We have complied cancer information from some of our most trusted sources. This article on managing pain is from **American Society of Clinical Oncology (ASCO)** and addresses the concerns patients may feel during or after chemotherapy.

**Pain - Managing Pain**

Many people with cancer experience pain, which can make other symptoms or side effects of cancer seem worse. However, nearly all cancer pain can be managed, with or without the use of medication.

**What causes pain?**

People with cancer may experience pain caused by the cancer itself or as a side effect of treatment. For example, a tumor may press on bones, nerves, the spinal cord, or organs, causing pain. In addition, pain may develop after surgery, radiation therapy, or chemotherapy.

Pain usually gets better over time, but some people may experience pain for months or years as a result of permanent damage to the nerves. Some pain, such as arthritis, lower back pain, or migraines, may not be related to the cancer at all. However, it is still important to tell a member of your health care team about this type of pain so it can be addressed as part of your overall treatment plan.

**What are the various types of pain?**

There are different types of cancer pain. Pain may last just a short time after a particular treatment or other event. Pain may only occur from time to time. Or, pain may be long-lasting and constant. Pain may also increase suddenly even though it is being treated. This is called breakthrough pain. It typically occurs between scheduled doses of pain medication, but it may not be linked to a specific movement or time of day.

**What does the doctor or nurse need to know about my pain?**

No matter what type of pain you experience, tell your doctor, your nurse, or another member of your health care team. The health care team’s role in managing pain is to listen to your concerns and offer a solution. The doctor or nurse may ask you to explain the intensity of the pain using a scale from 0 to 10 or use words, such as “burning,” “stabbing,” or “throbbing,” to help describe the pain. You should write down when and where your pain occurs and note whether anything makes the pain worse or relieves it. Some people find keeping a pain journal helps.
What are the treatment options for pain?

Doctors can manage pain by treating the source of the pain; changing how a person feels pain, usually with pain-relieving medications; or interfering with pain signals sent to the brain through spinal treatments or nerve blocks. If medication is needed, non-opioid painkillers, such as acetaminophen and ibuprofen, are used for mild to moderate pain. Doctors may also prescribe other medications, such as antidepressants or anti-seizure medicines, to help relieve some pain, particularly nerve pain. Opioids, such as morphine, may be used along with other methods when other options have not worked. In addition, where it is legal, medical cannabis or cannabinoids could be an option, along with other methods for unrelieved pain. Many people also find relief through other methods, including physical and occupational therapy, acupunture, and mindfulness practices, such as meditation or breathing exercises. A pain management plan may include a combination of medication and complementary methods, which are therapies, techniques, and products used in addition to conventional treatments. Questions to ask the doctor

Regular communication is important in making informed decisions about your healthcare. Consider asking the following questions of your health care team:

1. Based on my description of the pain, what do you think is causing it?
2. Would you explain the options for managing my pain with medication?
3. Which medication would you recommend?
4. Is there a risk for abuse of this medication?
5. What are the side effects of the medication?
6. How can these side effects be managed?
7. How long will I get pain relief from a dose of the medication you are suggesting?
8. How long will it take before I know how effective this medication regimen will be?
9. Why is it important for me to take my medication exactly as instructed?
10. Where and how should I store this medication?
11. What are other strategies for managing pain in place of or in addition to medication?
12. Where can I find emotional support for me and my family?
13. Whom should I call with questions or problems?
14. Is there anything else I should be asking?
